# DATA > SOFTWARE

The future of construction is **data-centric**

# data-driven construction.io

DataDrivenConstruction Toolkit is a powerful tool for exploring construction data without the need for an online connection or the installation of CAD (BIM) software. It supports the offline reading of BIM data and allows for the export of data to various formats such as DAE, USD, OBJ, CSV, Excel, JSON, XML, etc.

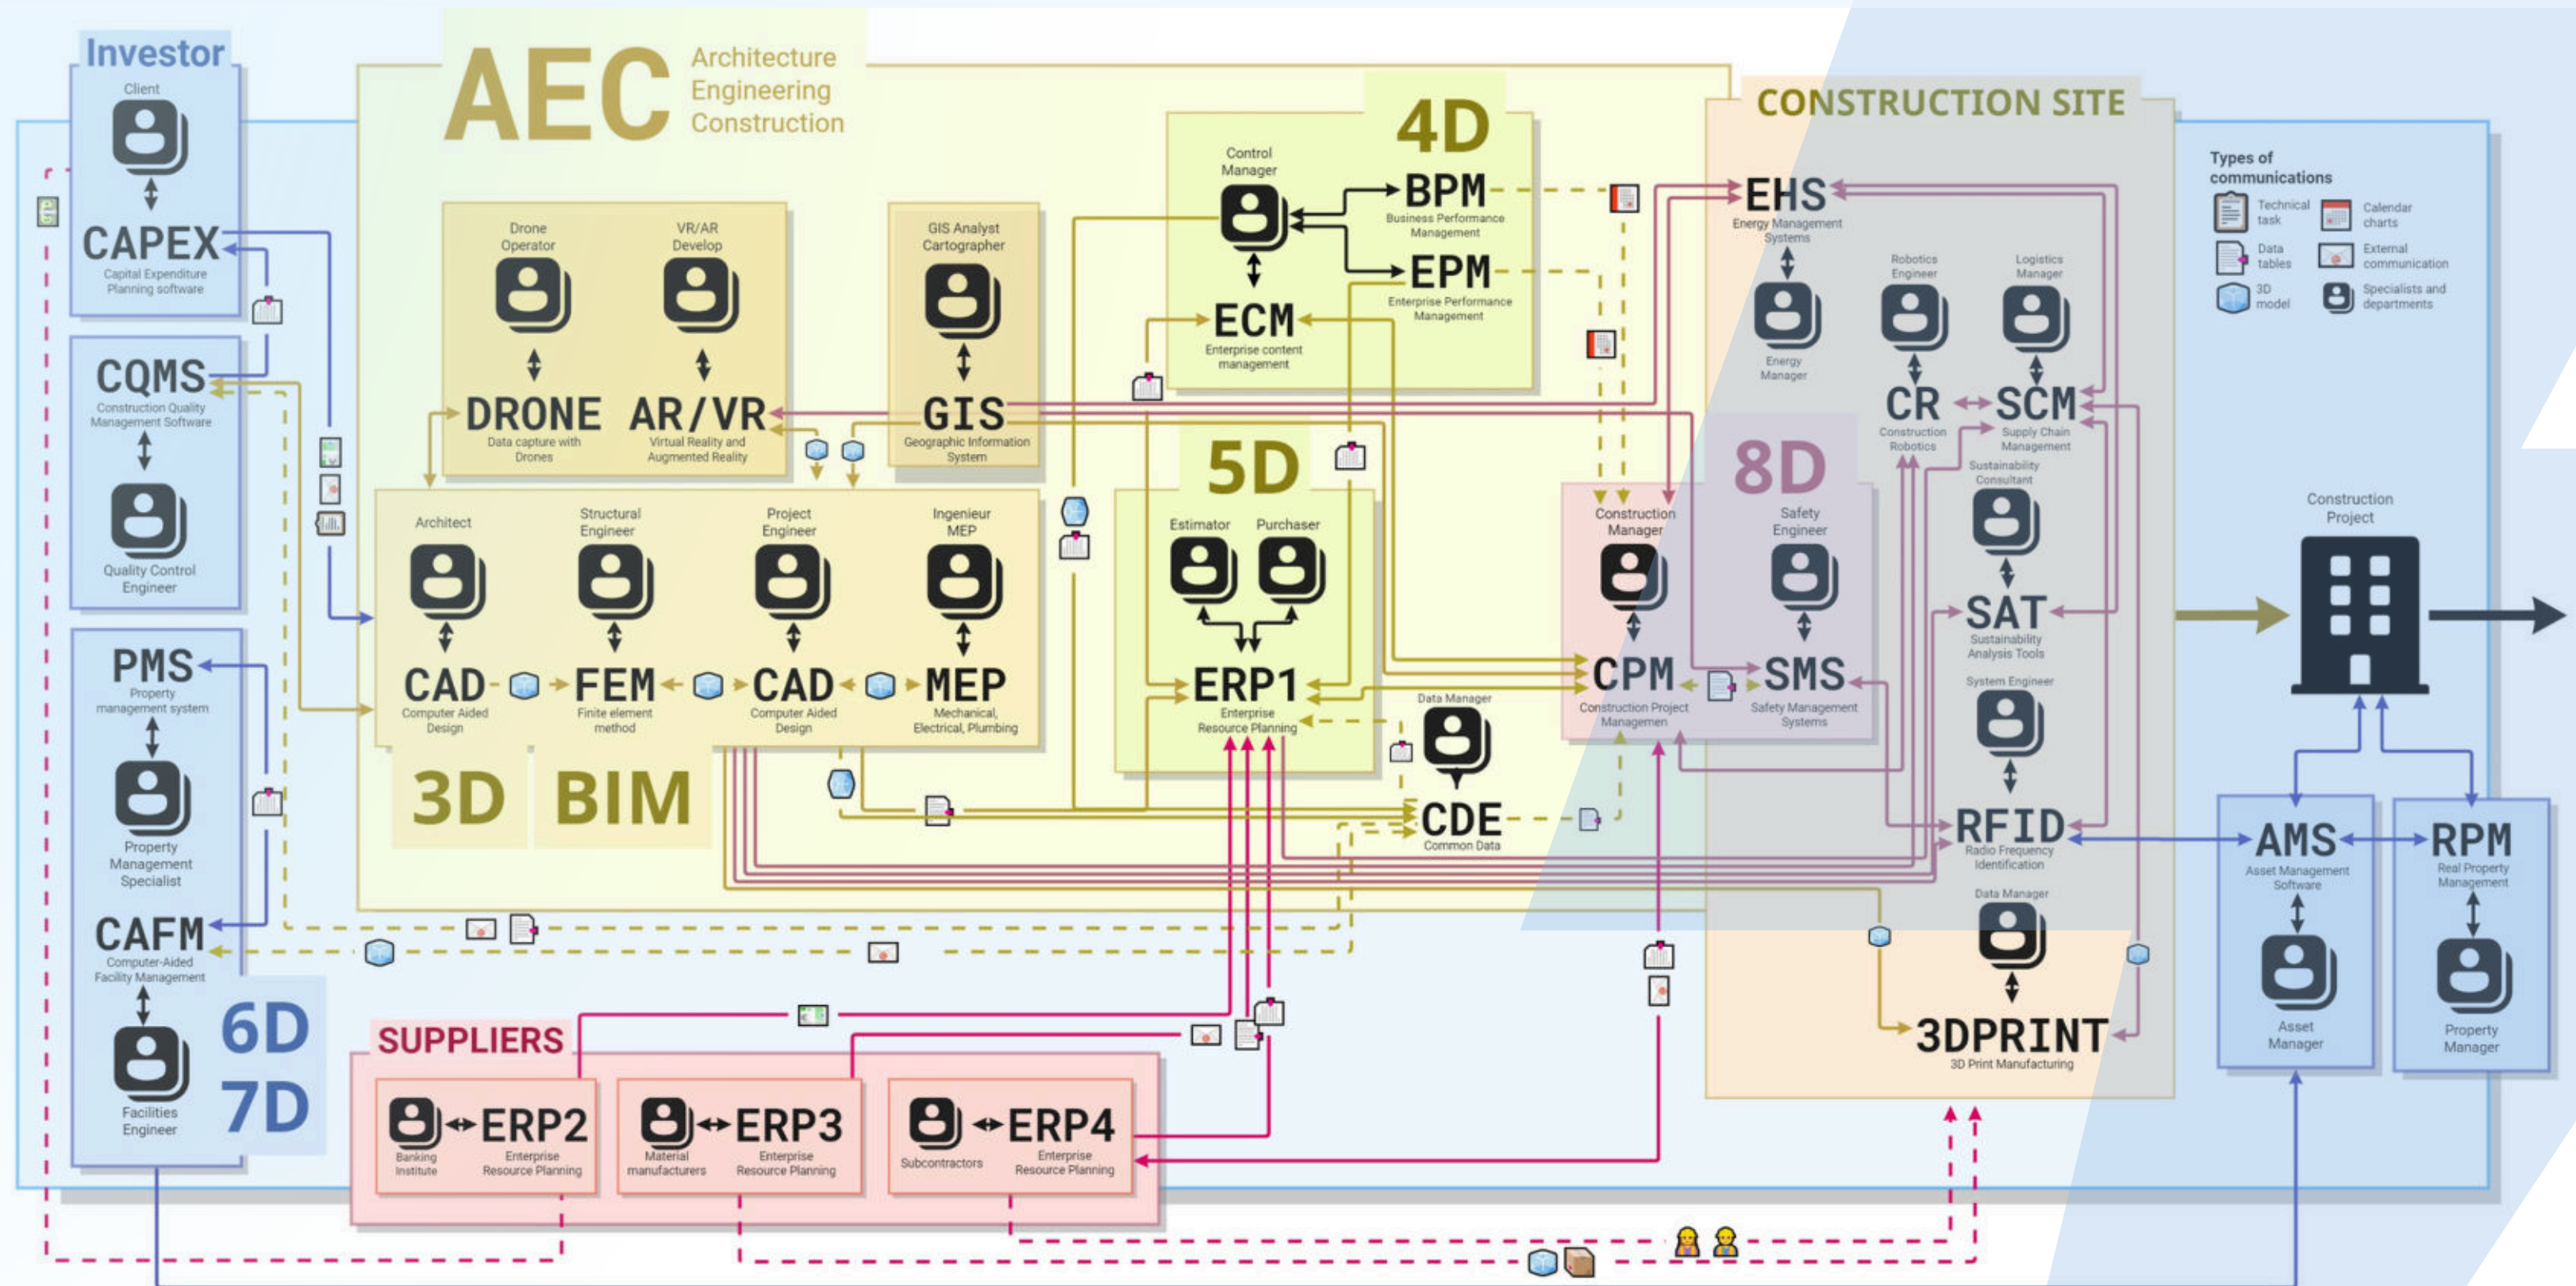

The central logo for the DataDrivenConstruction Toolkit features the letters 'DDC' in a bold, dark blue font, with a stylized blue lightning bolt striking through the 'C'. Below this, the word 'TOOLKIT' is written in a smaller, dark blue, sans-serif font. Surrounding this central logo are several white square icons with rounded corners, each containing a different logo: the R programming language logo, a geometric knot-like logo, the Python logo, a Microsoft Excel logo, a logo with a stylized 'u' or 'μ', a '.dwg' file format icon, and the OpenAI GPT logo. The entire central composition is set against a light blue background with a large, faint, purple and blue circular gradient. Scattered around the edges of this background are several small, 3D isometric cubes, each featuring different logos and symbols related to data science and construction, such as the R logo, Python logo, and various geometric shapes.

**DDC**  
**TOOLKIT**

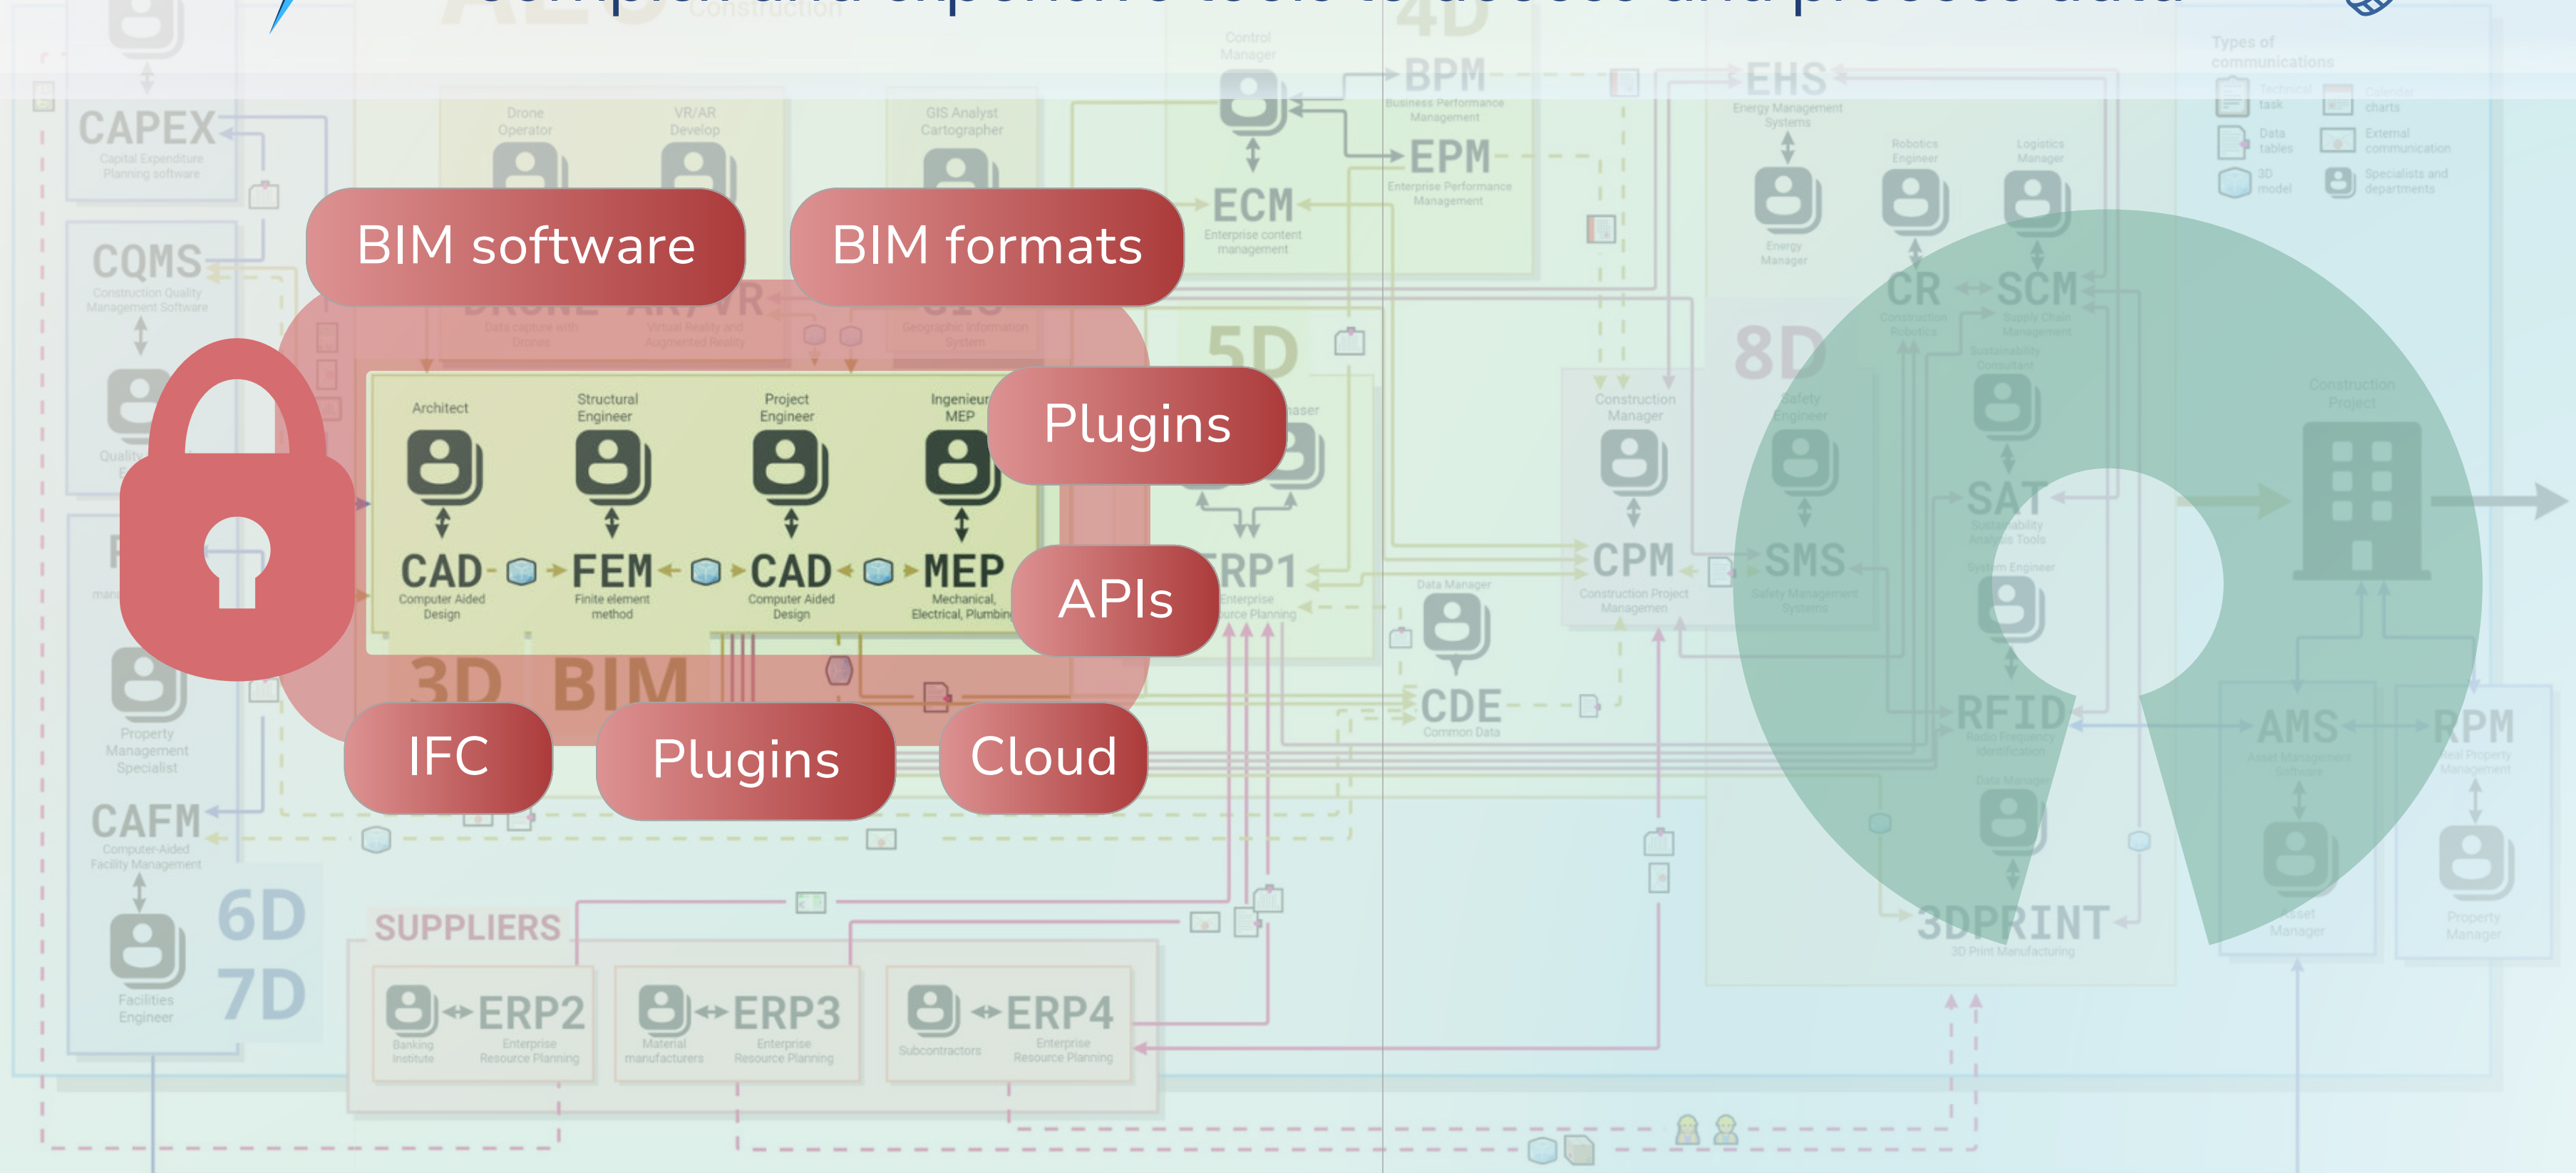

The construction business is filled with a lot of systems and data that need to be connected to each other

Closed and complex CAD (BIM) formats force users to use complex and expensive tools to access and process data

Thanks to SDKs and converters, different formats including complex closed formats, parametric formats and simplified flat formats **now contain identical information** about the same construction project

CAD (BIM) DATA

Geometric properties of project entities      Attribute properties of project entities

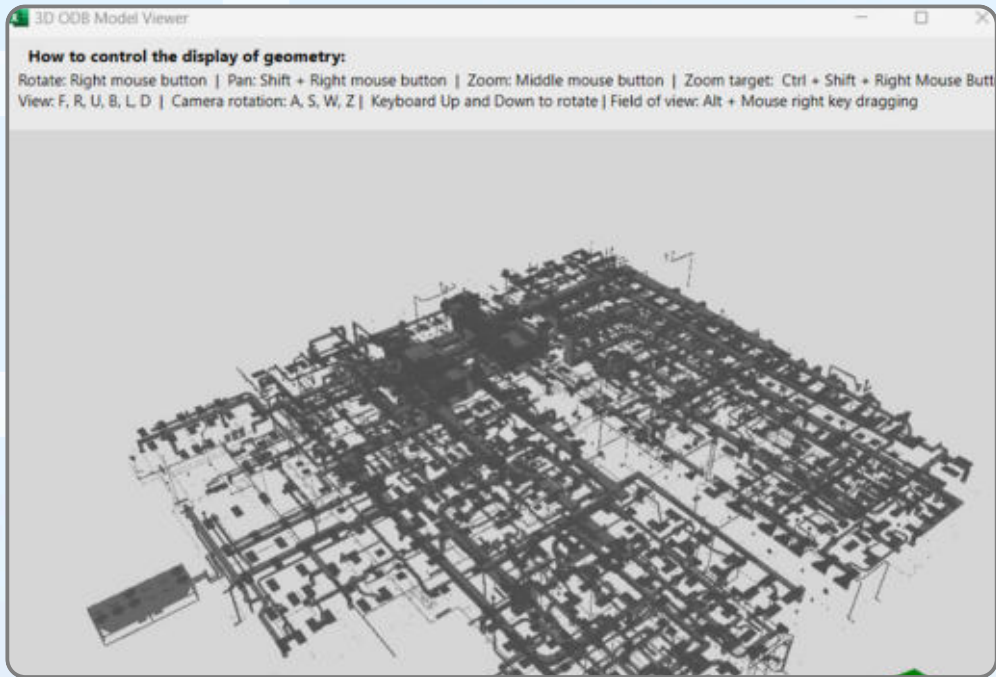

In construction projects, data manipulation begins with the collection of attribute and geometry requirements for project entities. Using parametrized CAD systems, the project is populated with data on the geometric parameters of the entities, which allows to confirm volumes and prepare data to be transferred to systems for handling the attribute parameters of the project entities.

A project, is a set of elements where **each element has a set of properties** and parameters and where geometry is an optional attribute

# From multi-format CAD (BIM) data into a structured format 🤗

## DATA CONVERSION TO OPEN FORMATS

```
RVT | IFC | DWG conversion.py

1 import os, subprocess
2
3 # Folder where the DDC converter is located
4 path_conv = r'C:\DDC_Revit_Community\datadrivenlibs\'
5 # Path address RVT | IFC | DWG project are located
6 file_path = r'C:\DDC\rstadvanced_sample.rvt'
7
8 # Conversion of one RVT project
9 process = subprocess.Popen([os.path.join(path_conv,
10 'RvtExporter.exe'), file_path], cwd=path_conv)
11
12 print("DDC Conversion process finished")
```

conversion in just 4  
lines of code

data-driven  
construction.io

RVT | IFC | DWG as DataFrame.py

```
1 # RVT | IFC | DWG project file name in XLSX format
2 output_file = file_path[:-4] + "_rvt.xlsx"
3 # Read the converted Excel file
4 df = pd.read_excel(output_file)
5 # Update column names to remove storage type in parameter
6 df.columns = [col.split(' : ')[0] for col in df.columns]
```

 Structured format is ideal for analytics, visualization and automation

## LOAD

Input

```
Importing Revit and IFC data.py

1 # Importing data for processing
2
3 import pandas as pd
4 df = pd.read_csv('C:\Revit_Sample.csv')
```

Output

	Id	Category	Type	Length	Volume
0	12577	Wall	Wall WD100	3200	1.0
1	15889	Wall	Wall STB 200	5400	6.0
2	76554	Door	Glazed Back Door	1300	0.3
3	74456	Window	Window 1700w	1700	0.5

snappily.io

## FILTER

Input

```
Filtering data in Revit and IFC projects.py

1 # Whether each element contains the values
2
3 df[df['Category'].isin(['Wall', 'Window'])]
```

Output

	Id	Category	Type	Length	Volume
0	12577	Wall	Wall WD100	3200	1.0
1	15889	Wall	Wall STB 200	5400	6.0
3	74456	Window	Window 1700w	1700	0.5

snappily.io

## GROUP

Input

```
GroupBy Revit IFC.py

1 # Grouping a Revit or IFC project by parameters
2
3 df.groupby('Category')['Volume', 'Length'].sum()
```

Output

Category	Volume	Length
Door	0.3	1300
Wall	7.0	8600
Window	0.5	1700

snappily.io

## PIE chart

Input

```
Pie chart.py

1 # Create a basic pie chart
2
3 df.groupby(['Type']).sum().plot.pie(y='Length')
```

Output

## BAR chart

Input

```
Bar plot.py

1 # The bar plot can be created as follows
2
3 dfp = df.groupby('Category')['Volume'].sum()
4 dfp.plot(kind='barh')
```

Output

## Regular Expression

Input

```
RegEx.py

1 #Regular expression in Revit and IFC
2
3 df[df['Category'].str.match('Wal*')]
```

Output

	Id	Category	Type	Length	Volume
0	12577	Wall	Wall WD100	3200	1.0
1	15889	Wall	Wall STB 200	5400	6.0

-	-	-
-	-	-
-	-	-

## QTO TakeOff

Input

```
QTO by RegEx.py

1 #QTO - Finding volumetric quantities for the group
2
3 dfq = df[df['Category'].str.match('Wal*')]
4 dfq = dfq.groupby('Category')['Volume', 'Length'].sum()
```

Output

	Volume	Length
Category		
Wall	7.0	8600

## EXCEL Data Export

Input

```
Export to Excel.py

1 # Creating a grouping and saving as Excel
2
3 dfe = df.groupby(['Category'])['Length'].agg(['sum', 'count'])
4 dfe.to_excel("output.xlsx", sheet_name='Category_estimate')
```

Output

	A	B	C	D
2	Door	1300	1	
3	Wall	8600	2	
4	Window	1700	1	
5				

Category\_estimate

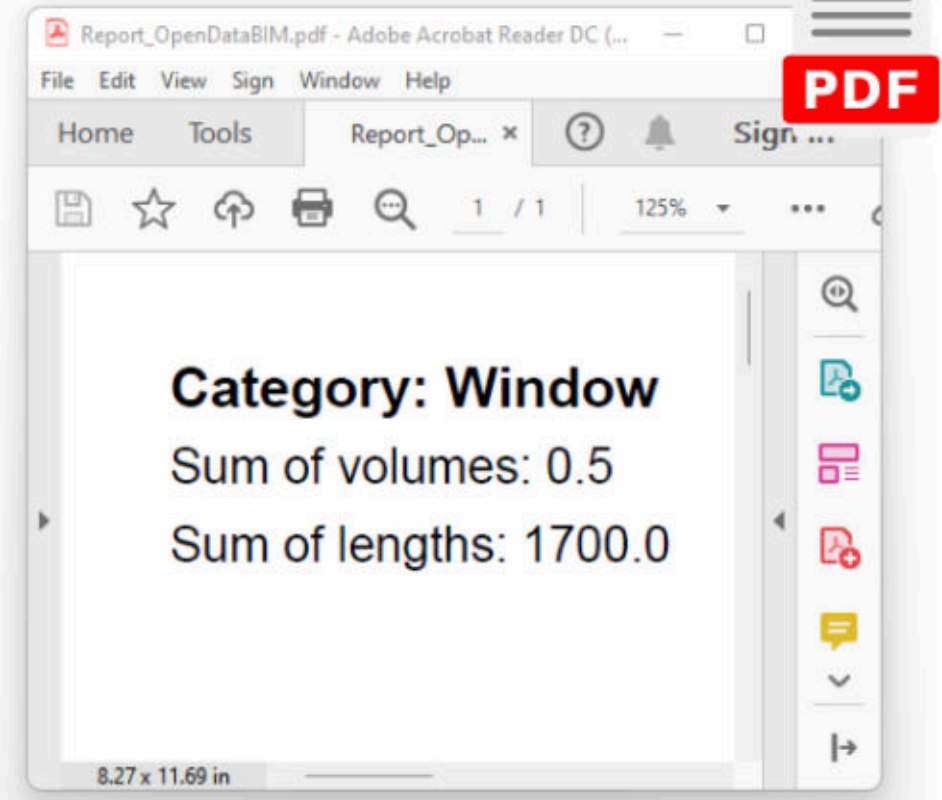

## PDF Document

Input

```
Creating a PDF document.py

1 from fpdf import FPDF
2
3 # Determining the volumetric characteristics of the group
4 s_cat = 'Window'
5 dfq= df[df['Category'].str.match(s_cat)]
6 dfq = dfq.groupby('Category')['Volume', 'Length'].sum()
7 cat_len = str(dfq.iloc[0]['Length'])
8 cat_vol = str(dfq.iloc[0]['Volume'])
9
10 # Creating a PDF document based on the parameters found
11 pdf = FPDF()
12 pdf.add_page()
13 pdf.set_font('Arial', 'B', 16)
14 pdf.cell(190, 8, 'Category: ' + s_cat, 2, 1, 'L')
15 pdf.set_font('Arial', '', 14)
16 pdf.cell(190, 8, 'Sum of volumes: ' + cat_vol, 2, 1, 'L')
17 pdf.cell(190, 8, 'Sum of lengths: ' + cat_len, 2, 1, 'L')
18
19 # Saving a document in PDF format
20 pdf.output('c:\Report_DataDrivenConstruction.pdf', 'F')
```

Output

## FILTER

Input

```
Filtering data in Revit and IFC projects.py

1 # Whether each element contains the values
2
3 df[df['Category'].isin(['Wall', 'Window'])]
```

Output

	Id	Category	Type	Length	Volume
0	12577	Wall	Wall WD100	3200	1.0
1	15889	Wall	Wall STB 200	5400	6.0
3	74456	Window	Window 1700w	1700	0.5

Filter the data in the project to keep the wall category items in the project

## GROUP

Input

```
groupBy Revit IFC.py

1 # Grouping a Revit or IFC project by parameters
2
3 df.groupby('Category')['Volume', 'Length'].sum()
```

Output

Category	Volume	Length
Door	0.3	1300
Wall	7.0	8600
Window	0.5	1700

Group the project by the "Type Name" parameter and show the volume of each group

## PDF

Input

```
Creating a PDF document.py

1 from fpdf import FPDF
2
3 # Determining the volumetric characteristics of the group
4 s_cat = 'Window'
5 dfq= df[df['Category'].str.match(s_cat)]
6 dfq = dfq.groupby('Category')['Volume', 'Length'].sum()
7 cat_len = str(dfq.iloc[0]['Length'])
8 cat_vol = str(dfq.iloc[0]['Volume'])
9
10 # Creating a PDF document based on the parameters found
11 pdf = FPDF()
12 pdf.add_page()
13 pdf.set_font('Arial', 'B', 16)

Compiling documentation from BIM model data in Revit and IFC formats ranks among the most labor-intensive tasks for managers

Benefits of automated documentation:

- Consistency
- Efficiency
- Accuracy
- Scalability
- Time Savings
- Up-to-date
- Customization
- Cost-Efficiency
- Traceability
- Adaptability

REPORT-001  
Table by rules from an Excel

This PDF document was created automatically from RVT files without using plug-ins, Revit or Forge

Link to the Master table that generated this document: [Link to the Master table](#)

Part 1: QTO according to the table with the rules

Abstract any calculation of data and processes in construction begins with table data, which allows you to track down the data in large information systems from which the required workflow is extracted. As an example of automation with data, the process of generating reports is compared. Different versions of a project, having a project of different resources, we need to understand the difference in the data and how many changes have been made to the project. Clearly comparing tables, we do not need data and can not understand changes between resources. In this example, the report will be an Excel table with QTO rules for grouping items in the model. This is what the table looks like:

ISO 15926-4:2018

data<sup>driven</sup>  
construction.io

REPORT-001  
Table by rules from an Excel

Part 2: Build concept

Using enough the table with the rules that have been created, we grouped the data into groups and created for them the aggregated values for the sum of resources or areas, depending on what was specified in the table.

ISO 15926-4:2018

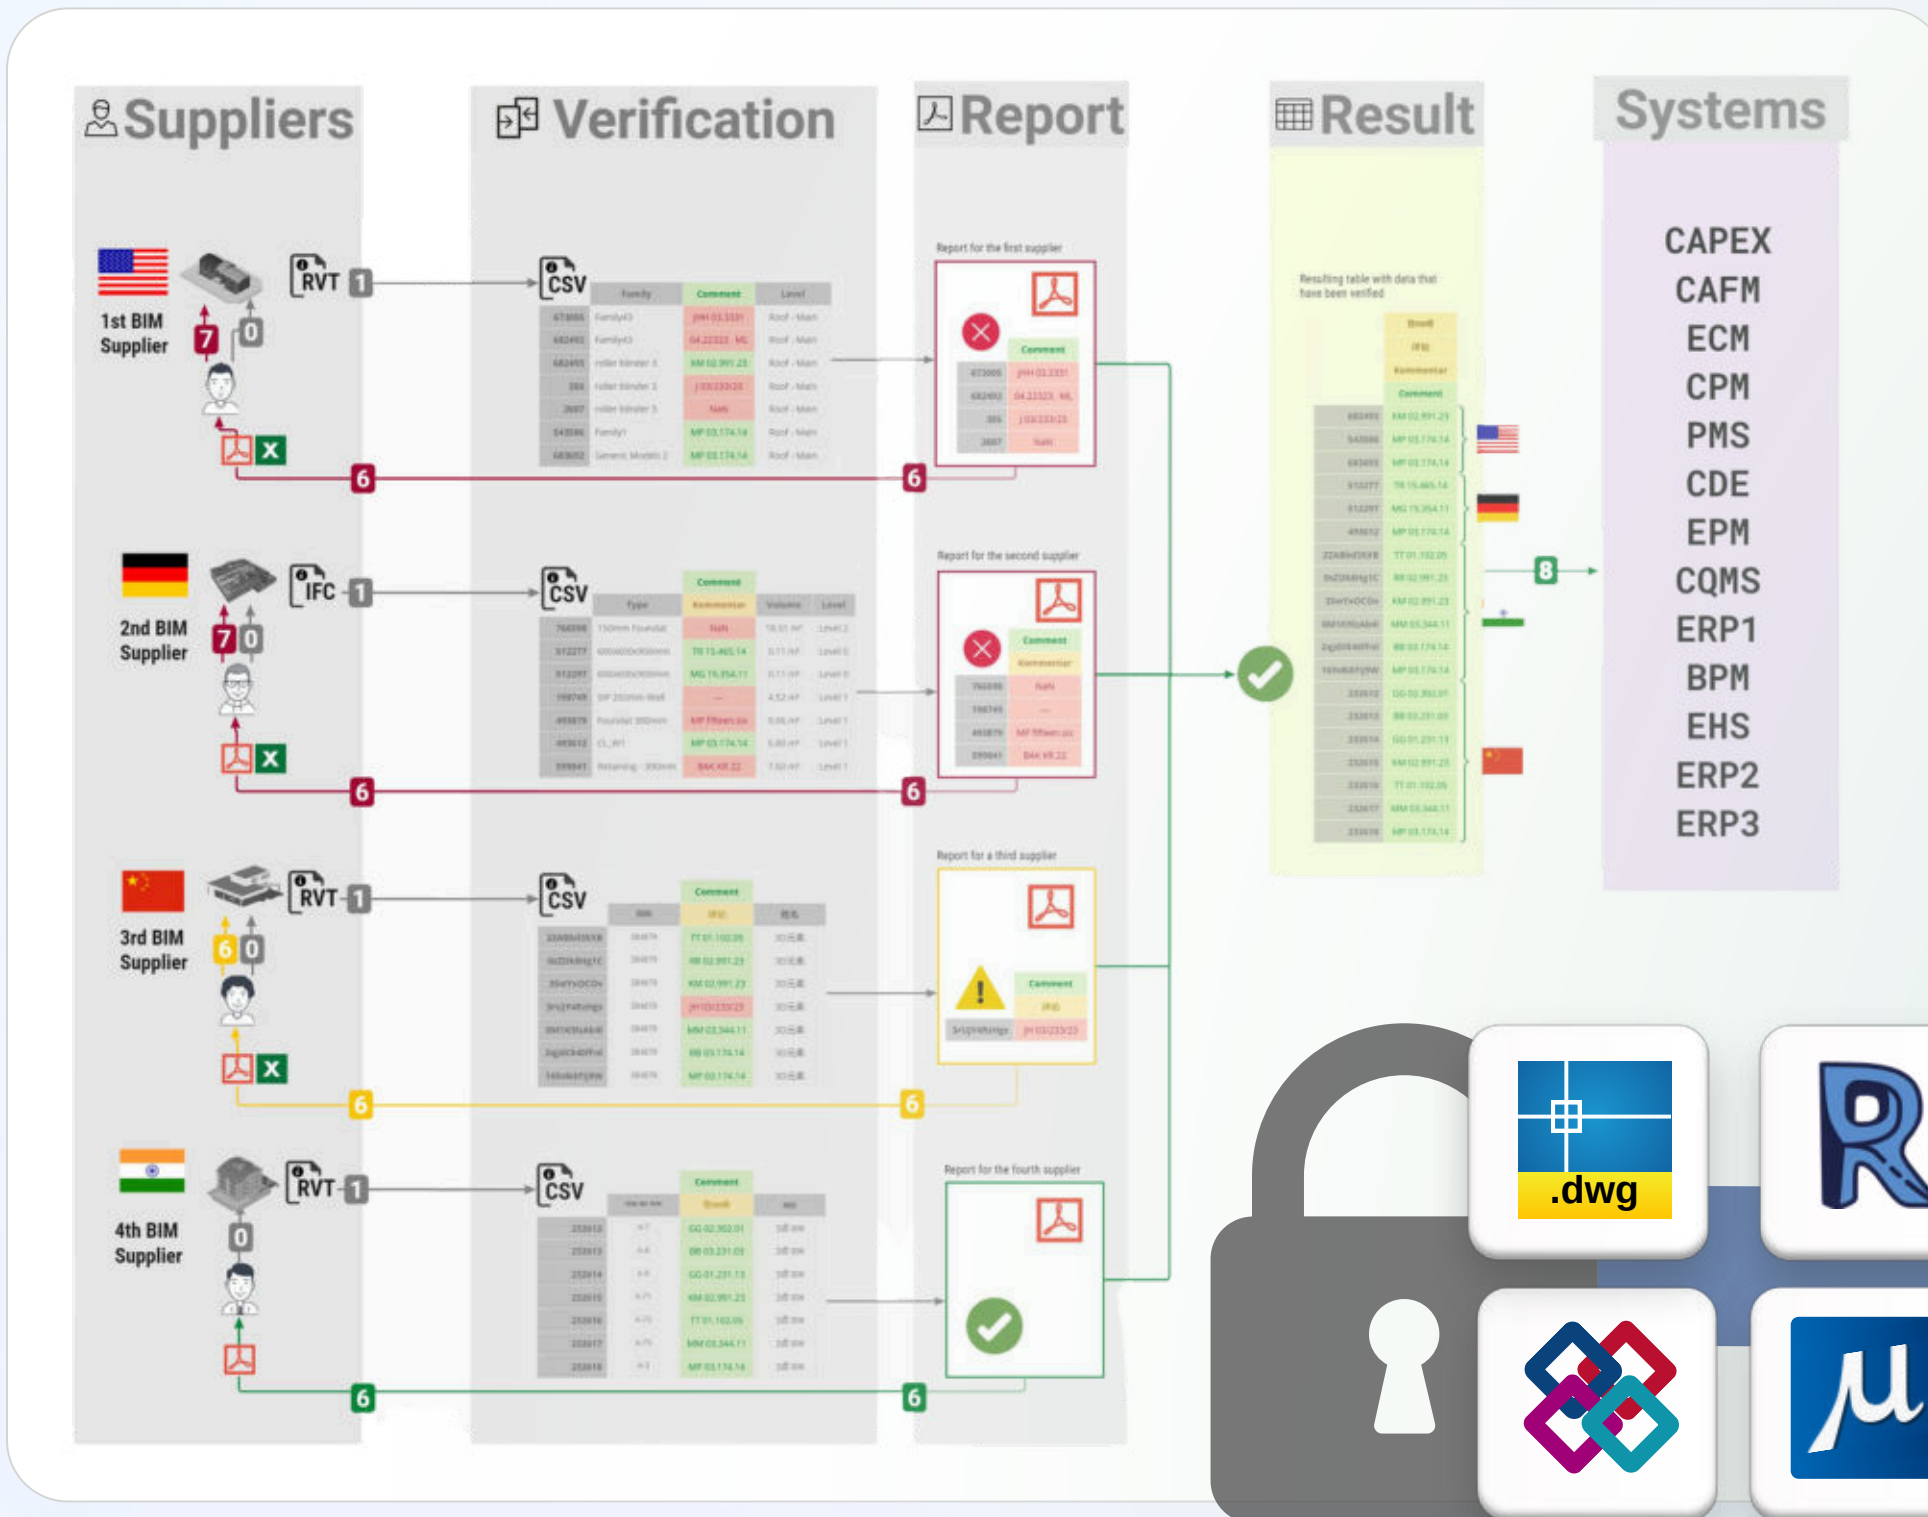

data-driven  
construction.io

Use case

Data visualisation of project data

Automated validation, utilizing logic and code, empowers a company to efficiently and accurately process 100s of files at once, ensuring consistent quality while reducing costs and human errors

# Utilizing Pipeline provides an exponential increase in productivity

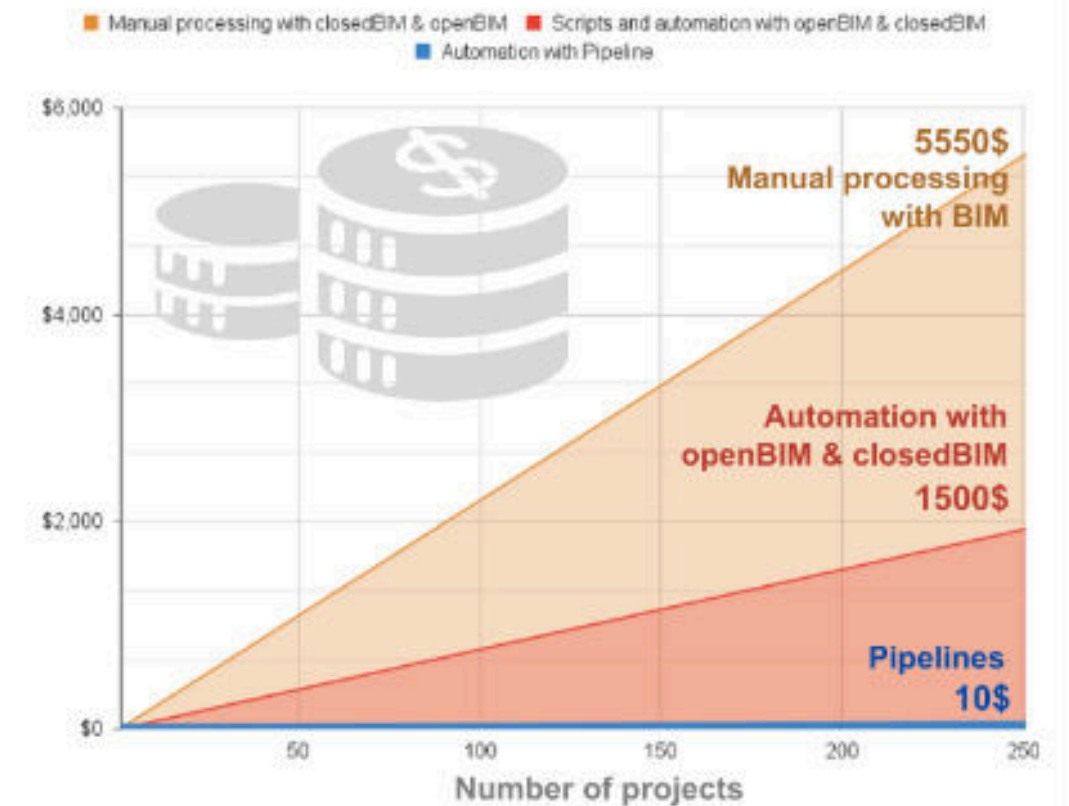

Reducing the cost of work and increasing productivity over time

Comparison of ROI of different automation concepts

Comparison of the cost of automating the tasks of extracting data from construction projects
